

How a Fortune 500 technology company increased their ROI with QMetry?

Performance was a key concern for our team considering our large volume of test cases. But QMetry was super impressive right from the get-go. Whether it was the migration of our test assets, providing weekend support for upgrades or downtime, movement of servers, syncing databases, everything was carried out efficiently and seamlessly. They also helped us create custom queries for our product.

Senior Manager - Quality Engineering

Our client is a leading multinational technology company and was looking for an enterprise-grade test management tool to organize test projects efficiently and execute a large volume of test data. The core requirement was for a central management tool for their globally distributed teams to manage their test projects seamlessly. QMetry's secure and scalable solution has been instrumental in optimizing test projects for 1000+ users across multiple regions for 5+ years now.

The Challenge

1

The client required management of projects across **multiple platforms and environments**. They also wanted to perform **bulk operations**.

2

To manage test cases and multiple projects across vendors and regions, they needed a tool that enabled **workflows** and permission-based access.

3

Their project team worked extensively in Jira and required **seamless integration with Jira** to manage defects and ensure traceability with relevant linkages.

4

They had a **lack of visibility** on the project status. They were looking for custom reporting solutions to gain actionable insights.

QMetry's Solution

QMetry allows selective **sharing of test cases** with multiple vendors for greater control over access and permissions. Our tool's built-in parent-child feature lets the client share a read-only view of test cases as applicable. Also, the **traceability feature** at global level helps track the usage and performance of test cases at multiple vendor points. Features like **bulk executions, bulk assignments** enable performing multiple operations quickly and easily.

The "Manage Platforms and Attributes" module leads to efficient management of a large number of **environment matrices**. Whereas **advanced reporting** with SQL helps the client combine reports from all modules and Jira fields. Stakeholders extensively use the **cross-project reporting** feature to take appropriate decisions on traceability, exporting 500+ reports daily.

Engagement Benefits

- ✓ Enhancing team collaboration in global, distributed teams with centralized test management tool
- ✓ Outstanding support and training from QMetry's client support team throughout the tool adoption
- ✓ Enterprise-grade test management capabilities help fulfil critical business needs such as security, roles, access, sharing, reusability and compliance
- ✓ Optimized time and resource efficiency with bulk operations and intuitive UI
- ✓ Highly scalable environment helped manage weekly surge in testing data
